Mind Map

Bright TV Planning

This project implements an end-to-end data analytics pipeline that transforms raw transactional sales data from BrightLearn TV (a bakery/café business) into actionable business intelligence. The architecture follows a modern medallion pattern (Bronze-Silver-Gold) using Databricks Delta Lake, with final deliverables including executive dashboards and strategic recommendations for the CEO.

Benifits of Mind Maps

A mind map is a powerful tool that helps the BrightTV team organize ideas into clear actions and processes. Whether working individually or as a team, it ensures that no important detail is missed while building and improving the platform.
When applied to the BrightTV project, a mind map helps the team to:

- **Explore and refine content and platform ideas**
- Identify which channels, features, and viewing experiences will deliver the most value to users.
- **Structure data and analytics processes**
- Organize how viewership data, user profiles, and insights are collected, analysed, and used for decision-making.
- **Map out end-to-end processes**
- Clearly define workflows such as content delivery, user engagement tracking, and reporting for management.
- **Allocate responsibilities across teams**
- Break down tasks between technical teams, data analysts, and business stakeholders to improve execution.
- **Generate new revenue and growth opportunities**
- Identify opportunities such as targeted advertising, premium users (VIP segments), and content expansion.
- **Align the team on insights and strategy**
- Use data (like user engagement, channel performance, and demographics) to drive discussions and keep everyone aligned.

Example

Notice!

Bright Tv Viewership Analysis

- **Dowloading of dataset**
  - Downloaded two Excel data Set file
  - Uploaded dataset into Databricks
  - Used join functions to join the data
  - stored the data in a schema volume in databricks
  - Writting of query
- **Coding of data in SQL**
  - Used join statement
  - Converted time to SA time
  - Used groupby stastemets
  - Used NULL fucntions
  - Date breakdown
- **Coding in SQL**
  - Created new columns
  - Created Durection Bucket
  - Created view profile status
  - Converted time from uct to SA
  - created day of the week bucket, weekday and weekend
- **Dowloaded data into excel**
  - Saved dowlaoded fle in a folder
  - Created pivot tables
  - cretaed graphs
  - Keys to Success⭐
- **Creating presentation**
  - created a power point presentation
  - loaded my presentaion in a folder
  - Bright_TV
- **CANVA Gantt Chat**
  - Created project plan Gannt chat
  - Save the gannt chat in a folder
- **GitHub**
  - Created a repository in GitHub
  - loaded all my folder in GitHub
  - Share repostory Link with Brightlearn

woo

I love this idea!
